Manuscript title: replace with the author-approved title

[Author names and order required]

[Affiliations and author mappings required]

Abstract. This is a layout preview, not a report of research findings. Replace this paragraph with an abstract grounded in the author's materials. Summarize the question, approach or argument, principal finding, and scope as appropriate to the article type. Include only information supported by the manuscript and its sources. Mark missing evidence explicitly rather than inventing content to fill the template.

Keywords: [Keywords required]

1. Question and context

Develop the opening from the author's question and literature: what is known, what remains unresolved, and why the present work addresses that problem. This preview is not study evidence or an official journal template. Choose section names and order for the article type and applicable venue.

2. Evidence and approach

Describe the actual methods, materials, assumptions, or synthesis procedure. Retain the documented scope, definitions, limitations, and uncertainty. Theory papers, reviews, and protocols need their own argument structure; the template does not prescribe experimental Methods and Results.

2.1. Equations and notation

The expression below demonstrates equation numbering and makes no empirical claim:

$$\bar{x} = \frac{1}{n}\sum_{i=1}^{n} x_i. \tag{1}$$

Define symbols and their domains; preserve units and parameter dependencies. Use native cross-references, such as Equation (1), to keep numbering consistent during revision.

3. Text, figures, and references

Keep adopted figure labels and values consistent with captions and prose. Ordinary floats fit the current column; starred floats span both columns. Resolve wide tables without making text unreadable. Table 1 illustrates formatting, not study data.

4. Interpretation and scope

Present supported interpretation, competing explanations, and material limitations. Match conclusions to the evidence; an association is not causation, and a planned validation is not a completed finding. Remove template instructions before manuscript delivery and flag any missing evidence or author decisions.

Table 1. Example manuscript inputs; no research data.

Component	Required input
Main text	Author materials and supported claims
Figures	Adopted versions and descriptions
References	Supplied or actually verified sources

5. Sources and citations

Keep important claims traceable to author materials or adopted literature. Preserve citation keys, their positions, and the scope of support during revision. The bibliography file is deliberately empty: do not invent authors, titles, or reference numbers to demonstrate a citation style. Supplied references are not automatically verified sources. Mark missing support clearly and distinguish it from evidence-backed prose. A successful bibliography build establishes that citations resolve, not that their scientific interpretation is correct.

6. Source files and revisions

Maintain the title, authors, and affiliations in the metadata file, with the abstract and body in section files. Split sections when useful and organize them around one authoritative manuscript source. Avoid maintaining divergent copies in several formats. A major revision or journal change should retain the reviewed version and its adopted figure relationships. Continue the template and column choice already settled for the project; another language edit does not require choosing the layout again.

7. Compilation and page review

Deliver the editable source project and the PDF actually compiled from it. Check citations, cross-references, equation numbers, and required characters. An old PDF remaining on disk does not establish that the current revision built successfully. Inspect rendered pages for complete title and abstract blocks, readable columns, unclipped tables and equations, and unobstructed headers and page numbers. Recompile and inspect affected pages after a layout fix. The placeholder content in this preview must be replaced before it can be delivered as a completed manuscript.
